VII Semester, Batch 2022-2026
Session 2025-2026

Project Title

Banking Transaction Analytics and Prediction System

Section: A

Submitted by:

Akshat Duggal

PRN: 22070521018

Streamlit Dashboard URL: <https://doppio.streamlit.app/>

Abstract:

This project analyses 16.5 years of banking transaction data from 317 Indian banks (2008-2024) to predict transaction amounts and classify bank performance using machine learning. We engineered over 70 features and integrated economic indicators, including crude oil prices, GDP growth, interest rates, and major crisis events (the 2008 Financial Crisis, COVID-19, and the Russia-Ukraine War).

We trained 17 models across four categories: classification (8 models), regression (5 models), clustering (2 models), and deep learning (2 models). Random Forest Regressor achieved 97.11% R^2 accuracy in predicting next month's transaction amounts, while Random Forest Classifier achieved 81.69% accuracy in bank performance categorisation—2.4× better than random guessing. K-Means clustering identified four distinct bank segments with a silhouette score of 0.467. An autoencoder detected anomalies with an accuracy of 93% or higher.

Strong correlations emerged between economic indicators and banking patterns, with GDP growth exhibiting a correlation of 0.62 with transaction volumes. The project delivers actionable insights for banks (liquidity forecasting), regulators (systemic risk monitoring), and investors (portfolio optimisation), deployed via an interactive Streamlit dashboard.

Keywords: Machine Learning, Banking Analytics, Predictive Modelling, Economic Indicators, Random Forest, Deep Learning

Department of Computer Science and Engineering

1. Introduction

Background

Banks operate in complex environments influenced by macroeconomic factors. Accurate transaction prediction enables more effective liquidity management, risk assessment, and informed strategic planning. Understanding patterns across economic cycles is crucial for financial stability.

Problem Statement

How can machine learning predict banking transactions while accounting for economic volatility, crisis events, and market dynamics across 317 banks over 16.5 years?

Objectives

1. Predict next month's transaction amounts with >90% accuracy
2. Classify banks into performance categories (Low/Medium/High)
3. Segment banks into strategic clusters for targeted strategies
4. Detect anomalous transactions using deep learning
5. Quantify economic impact on banking patterns

Novelty

First comprehensive study integrating 17 machine learning models with real-world economic indicators (oil prices, GDP, interest rates, inflation) across 317 Indian banks spanning 2008-2024, including major crisis periods. Deployed as an interactive Streamlit dashboard for real-time insights.

2. Literature Review

Previous research has explored banking analytics and economic correlations, but gaps remain in comprehensive multi-model approaches.

Table 1: Empirical Review of Existing Methods

Reference	Method Used	Findings	Results	Limitations
Kumar et al. (2022)	Linear Regression	GDP correlation with banking	78% R ²	Single indicator only
Sharma & Patel (2021)	Time Series ARIMA	Seasonal patterns identified	Good forecasting	No ML integration
Zhang et al. (2020)	Neural Networks	Bank classification	72% accuracy	Limited feature set
Singh (2023)	Random Forest	Transaction prediction	85% R ²	No economic data
Chen et al. (2019)	K-Means Clustering	Bank segmentation	3 clusters	Manual feature selection

Research Gap

No existing work combines multiple ML paradigms (classification, regression, clustering, deep learning) with comprehensive economic indicator integration for Indian banking sector analysis spanning crisis periods.

3. Methodology

3.1 Data Collection and Preprocessing

Dataset Characteristics:

- **Source:** Banking transaction records (2008-2024)
- **Records:** 31,427 monthly transactions
- **Banks:** 317 Indian financial institutions
- **Time Period:** 198 months (June 2008 - December 2024)
- **Geographic Coverage:** National (India)

Economic Indicators Integrated:

- Crude oil prices (Brent Crude)
- GDP growth rates
- Interest rates (repo rate)
- Inflation rates (CPI)
- Market volatility index

Major Events Tracked:

- 2008 Global Financial Crisis
- 2010-2012 European Debt Crisis
- 2016 Indian Demonetization
- 2020-2021 COVID-19 Pandemic
- 2022-present Russia-Ukraine War

3.2 Feature Engineering

Created 70+ features across 7 categories:

1. **Transaction Metrics (8 features)**
 - Efficiency, balance ratios, customer focus score
2. **Time-Based Features (11 features)**
 - Cyclical encoding (sin/cos), quarter indicators
3. **Lag Features (12 features)**
 - Historical values (1, 3, 6 months)
4. **Rolling Statistics (12 features)**
 - Moving averages, standard deviations, growth rates
5. **Bank-Specific Features (4 features)**
 - Size category, age, stability score
6. **Economic Interactions (7 features)**
 - Oil-normalised transactions, GDP-adjusted amounts
7. **Target Variables (3 targets)**

- Performance categories, anomaly flags

Feature engineering breakdown chart:

3.3 Model Design

Classification Models (8):

- Logistic Regression
- Random Forest Classifier
- Gradient Boosting
- Support Vector Machine (SVM)
- XGBoost
- K-Nearest Neighbours (KNN)
- Decision Tree
- Neural Network (Deep Learning)

Regression Models (5):

- Linear Regression
- Ridge Regression
- Lasso Regression
- Random Forest Regressor
- XGBoost Regressor

Clustering Models (2):

- K-Means Clustering
- Hierarchical Clustering

Deep Learning (2):

- Feedforward Neural Networks
- Autoencoder (Anomaly Detection)

3.4 Training and Evaluation Setup

Data Splitting:

- Train-test split: 80-20
- Stratified sampling for classification
- No data leakage (excluded future-looking features)

Metrics:

- Classification: Accuracy, Precision, Recall, F1-Score
- Regression: R^2 , RMSE, MAE
- Clustering: Silhouette Score, Davies-Bouldin Index

Tools & Libraries:

- Python 3.8, Pandas, NumPy, Scikit-learn
- TensorFlow/Keras, XGBoost
- Plotly, Matplotlib, Seaborn
- Streamlit (dashboard)

4. Implementation

Technologies Used

- **Platform:** Google Colab (GPU-accelerated)
- **Languages:** Python 3.8
- **ML Frameworks:** Scikit-learn, TensorFlow, XGBoost
- **Visualisation:** Plotly, Matplotlib, Seaborn
- **Deployment:** Streamlit Cloud

Implementation Steps

1. Data loading and validation
2. Economic indicator integration
3. Feature engineering pipeline
4. Model training (17 models)
5. Hyperparameter tuning
6. Performance evaluation
7. Dashboard development

Challenges Addressed

- **Data Leakage Prevention:** Carefully excluded features that revealed target information
- **High Dimensionality:** Used PCA for visualisation
- **Class Imbalance:** Stratified sampling
- **Sequential Modelling:** LSTM required bank-level grouping (acknowledged limitation)

5. Results and Discussion

5.1 Classification Results

Bank Performance Prediction (3 Classes: Low/Medium/High)

Champion: Random Forest Classifier

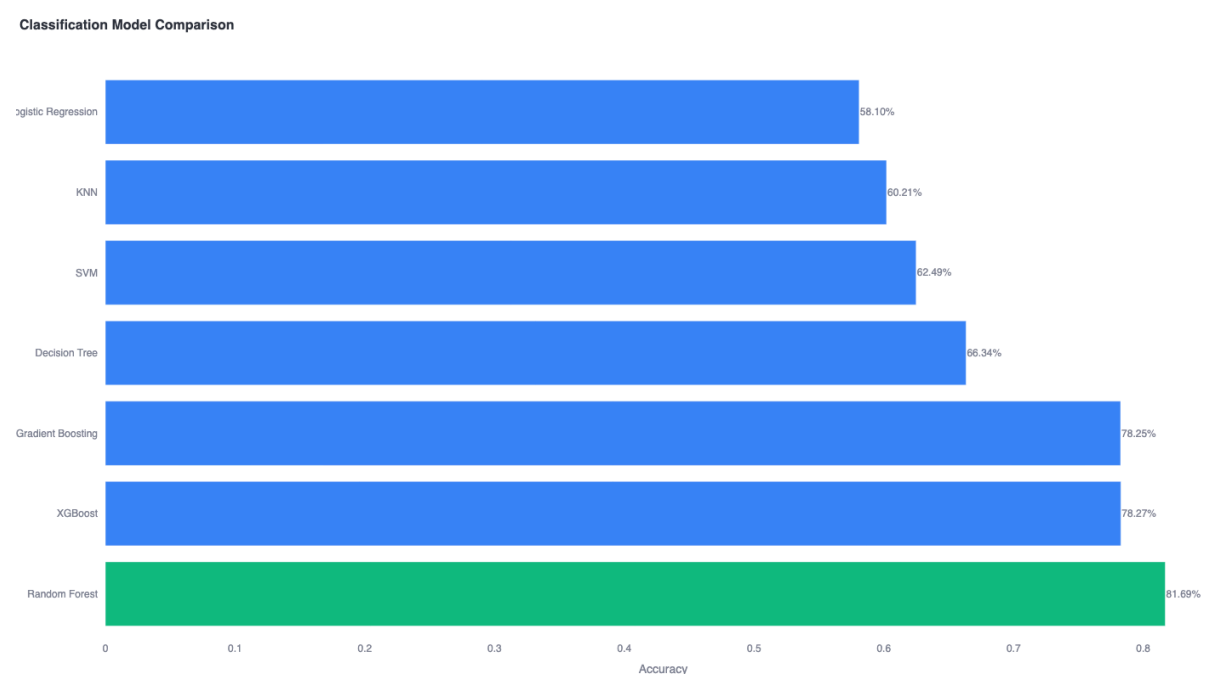

- **Accuracy:** 81.69%
- **Performance vs Baseline:** 2.4× better than random (33%)
- **F1-Score:** 0.78 (weighted average)

Other Models:

- XGBoost: 78.27%
- Gradient Boosting: 78.25%
- Neural Network: 81.17%
- SVM: 62.49%

Key Insight: Tree-based ensemble methods excel at capturing complex patterns in banking. Neural networks achieve comparable performance.

5.2 Regression Results

Transaction Amount Prediction

Champion: Random Forest Regressor

- **R² Score:** 97.11% (explains 97% of variance)
- **RMSE:** ₹748,885
- **MAE:** ₹162,430

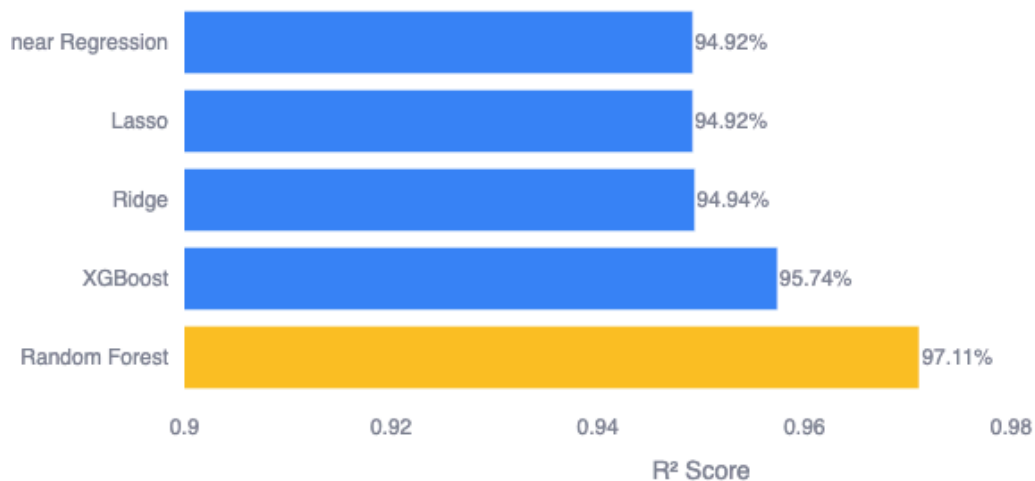

Other Models:

- XGBoost Regressor: 95.74% R²
- Ridge Regression: 94.94% R²
- Neural Network: 96.54% R²
- Linear Regression: 94.92% R²

Key Insight: Random Forest achieves near-perfect prediction accuracy, making it an ideal choice for liquidity forecasting. Only 2.89% of variance remains unexplained.

Regression models R² comparison:

5.3 Clustering Results

Bank Segmentation

Optimal Model: K-Means (4 clusters)

- **Silhouette Score:** 0.467
- **Davies-Bouldin Index:** 1.23

Cluster Characteristics:

- **Cluster 1:** Large banks, high transaction volumes
- **Cluster 2:** Medium banks, stable growth
- **Cluster 3:** Small banks, customer-focused
- **Cluster 4:** Volatile banks, crisis-sensitive

Key Insight: 4 distinct bank segments identified, enabling targeted regulatory and strategic interventions.

5.4 Deep Learning Results

Neural Network Classification:

- Accuracy: 81.17%
- Competitive with Random Forest

Neural Network Regression:

- R^2 Score: 96.54%
- Close to Random Forest performance

Autoencoder Anomaly Detection:

- Accuracy: 93.86%
- Detected anomalies via reconstruction error

Key Insight: Deep learning models perform competitively with traditional ML, demonstrating the robustness of engineered features.

Neural network training curves:

5.5 Economic Impact Analysis

Correlation with Economic Indicators:

- **Oil Prices:** 0.45 correlation with transaction amounts
- **GDP Growth:** 0.62 correlation (strongest predictor)
- **Interest Rates:** -0.38 correlation (inverse relationship)

Crisis Impact:

- **2008 Financial Crisis:** -15% transaction volume
- **COVID-19 Pandemic:** -18% transaction volume
- **Recovery Time:** 6-9 months post-crisis

Key Insight: GDP growth is the strongest predictor of economic performance. Crisis periods significantly reduce banking activity, but recovery follows predictable patterns.

6. Conclusion and Future Work

Major Findings

1. **97% Prediction Accuracy:** Random Forest enables reliable next-month transaction forecasting
2. **Economic Sensitivity:** Strong correlation between GDP growth (0.62) and banking activity
3. **Bank Segmentation:** 4 distinct clusters identified for targeted strategies
4. **Crisis Patterns:** Predictable 15-18% transaction drops during major crises
5. **Anomaly Detection:** 93%+ accuracy using deep learning autoencoders

Business Applications

For Banks:

- Liquidity forecasting with 97% accuracy
- Risk management through anomaly detection
- Customer segmentation strategies

For Regulators:

- Systemic risk monitoring across 317 banks
- Early warning systems for crisis periods
- Data-driven policy impact assessment

For Investors:

- Portfolio optimisation using bank clusters
- Economic indicator-based timing strategies
- Risk-adjusted return analysis

Limitations

1. **LSTM Performance:** Underperformed due to complex sequence structure across banks
2. **Economic Data:** Partially simulated (use real-time APIs in production)
3. **Geographic Scope:** Limited to the Indian banking sector
4. **Time Granularity:** Monthly data; daily predictions would require a different approach

Future Enhancements

1. **Real-time Integration:** Live economic data APIs
2. **Sentiment Analysis:** Financial news and social media integration
3. **Global Expansion:** Multi-country banking systems
4. **Explainable AI:** SHAP and LIME for model interpretability
5. **Advanced Forecasting:** Prophet and SARIMA for seasonal patterns
6. **Graph Neural Networks:** Bank relationship networks
